

Snohomish County PUD Integrated Resource Plan

Kris Scudder – Principal Utility Analyst Garrison Marr – Senior Manager Power Supply December 2, 2025

Agenda

- Introductions
- Integrated Resource Planning Overview
- 2025 IRP Results

What is an IRP?

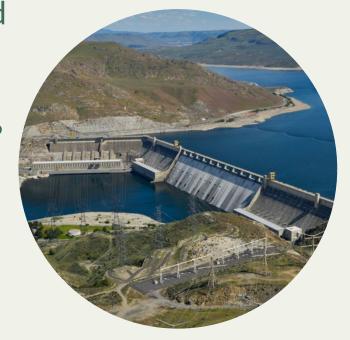

See our current and previous IRP's at www.snopud.com/IRP

An IRP:

- Forecasts future electricity supply and demand
- Evaluates potential resources for costs, benefits and risks
- Selects an optimal mix of resources that results in the lowest reasonable cost to customers
- Sets a near-term Action Plan for the PUD
- Is required by law for utilities of the PUD's size
 - Clean Energy Transformation Act
 - "Clean energy" planning
 - Energy Independence Act
 - Renewable Portfolio Standard
 - Biennial Conservation Targets
- Is completed every 4 years and updated 2 years thereafter

An Integrated Resource Plan (IRP) asks: How best should we serve our customer-owners?

- 1. What **possible futures** could the PUD face through 2045?
- 2. Does our existing energy portfolio meet our customers' needs through these futures?
- 3. Do we need to add resources?
- 4. When are new resources needed?

5. How do we get from where we are today to where we are going?

Our IRP Process

Phase 1 Visioning & Scoping

- Ask customers for perspectives through public process
- •Use technical team of subject matter experts
- •Find key study elements
- Create scenarios and sensitivities to scope the IRP

Phase 2 Load Resource Balance

- Determine future load needs after load growth from electrification, electric vehicles and population growth
- Examine current resource portfolio for adequacy
- Assess when needs occur and size of potential requirement

Phase 3 Resource Options

- Survey available technologies for attributes and costs
- Evaluate potential future solutions
- Assess demand (customer) side resources
- Create a menu of potential clean solutions

Phase 4 Optimization

- Use in-house developed optimization engine to solve for least-cost solution for each scenario
- Develop resource plan for each scenario and sensitivity

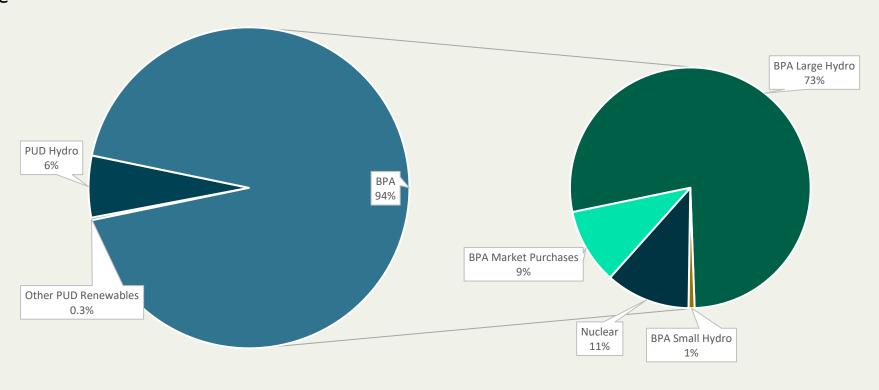

Phase 5 Resource Strategy

- Develop a flexible resource strategy to meet future customer needs
- Develop an action plan to make progress toward the long-term resource strategy

Our Clean Portfolio

Example 2026 Power Portfolio

- We primarily have hydroelectric energy resources, mostly from the federal Bonneville Power Administration
- The PUD owns or contracts for other smaller resources such as our owned Jackson Hydro Project at Spada Lake

Scenarios & Sensitivities

Base

"Expected Scenario"

High Growth

• "Economic upturn"

Low Growth

"Economic downturn"

High Tech

New technology develops faster

 Fewer renewable resources available

Single Clean Energy Policy

Load Forecast - Average Annual Load

Base Case

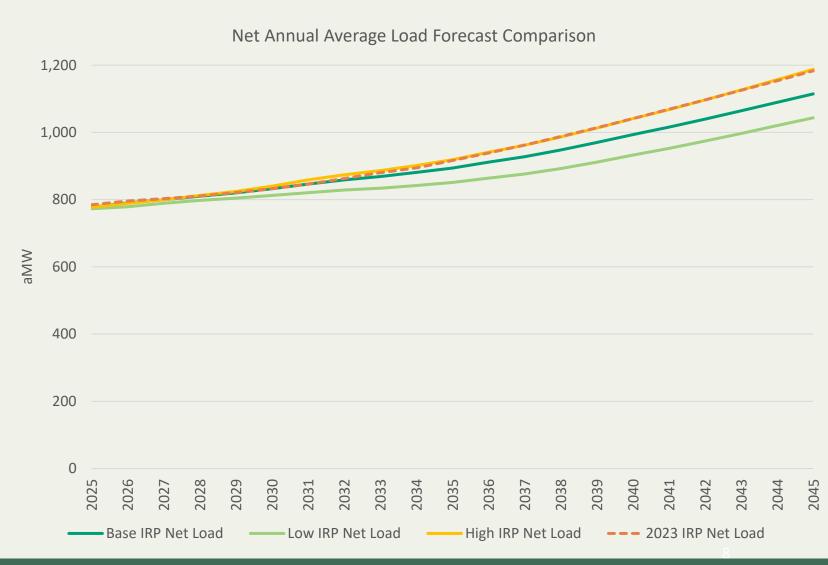

- 1.82% avg annual load growth
- 43% net load increase over study period

High Case

- 2.14% avg annual load growth
- 53% net load increase over study period

Low Case

- 1.51% avg annual load growth
- 35% net load increase over study period

Demand-side Resources

- Conservation Potential Assessment (CPA)
 - We do a conservation potential assessment every IRP to determine the energy savings available in our service territory.
 - Conservation programs reduce the energy needed by our customers; it has been our most costeffective resource, and we invest in our communities.
 - Using our existing resources more efficiently and not purchasing new energy sources reduces the costs of our power portfolio.
- Solar Potential Assessment (SPA)
 - New! Will assess potential for further incentivizing large customer-owned solar
 - Customer feedback suggested we look at customer-owned solar as a resource in new ways. The SPA looks at costs and benefits of an incentive offered.
- Demand Response Potential (DRPA) Shared Energy Management
 - Demand Response (DR) means shifting or temporarily reducing energy usage during peak hours using technology or incentives.
 - DR helps reduce costs by deferring or reducing the need for infrastructure upgrades and our peak hour energy costs.

Supply Side Resource Menu - Candidate Resources

Baseload Resources

- Firmer generation profile
- Geothermal
- Solar + Storage
- Wind + Storage
- BPA Tier 2 Power
 - Short-Term Tier 2
 - Long Term Tier 2
- Small Modular Nuclear Reactors (E WA, late 2030's)
- Local Fusion (2040's)

Variable Resources

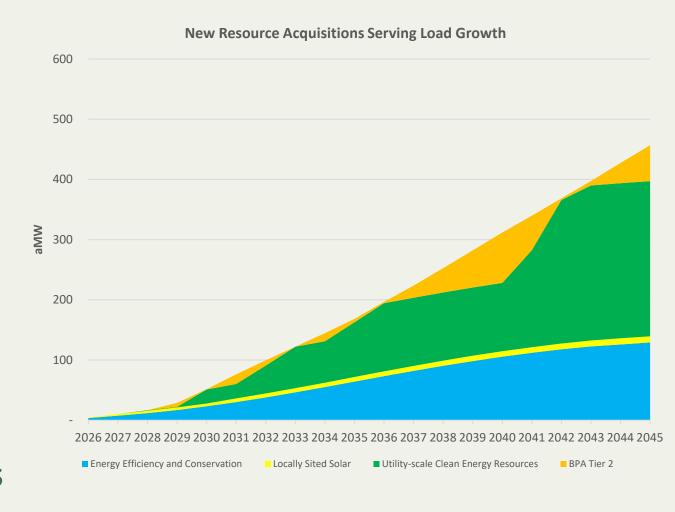

- Cheaper, less firm profile
- New Local ROR Hydro
- Small Hydro Buyout
- Small, Local Utility Scale
 Solar (1-5 MW)
- Regional Utility Scale Solar (25+ MW)
- Gorge Wind
- Montana Wind
- Customer Rooftop Solar
 Incentive Rooftop Solar
 Potential Assessment

Dispatchable Resources

- Can turn on/off for peaks
- Biodiesel Peaker
- 4-Hr 25MW Li-Ion Battery Storage
- 100-Hr Iron-Air Battery
- Long Duration Local
 Pumped Storage Hydro

At-A-Glance: 2025 IRP Resource Strategy

- Conservation, Demand Response, and Renewable Resource investments are the primary resource additions that result in lowest costs
 - These results are similar to previous IRPs
 - Regulatory compliance considerations drive resource investments, which would be augmented by environmental attribute purchases
- Short-Term BPA Power purchases (Tier 2) are used as a bridge between resource additions

2025 IRP Near-Term Actions

- Acquire 7.5 annual aMW of cost-effective Conservation by 2027
- Develop cost-effective Demand Response & Smart Rates
- Develop local PUD solar and explore programs for large (>50kW) customer-owned solar resources
- Perform additional due diligence on local battery energy storage
- Develop a strategy and framework to manage new large load requests
- Continue to build and enhance community engagement on longterm planning, including outreach to more communities, and with support for multiple languages
